QUINOLIZINONES AS INTEGRIN INHIBITORSFIELD OF THE INVENTION

5 The present invention relates to compounds that inhibit certain integrins, particularly to compounds that inhibit $\alpha_v\beta_3$ and $\alpha_{IIb}\beta_3$ integrins, their synthesis and their use as integrin inhibitors.

10 BACKGROUND OF THE INVENTION

Integrins are a family of cell adhesion receptors. The integrin family of proteins are expressed on the surface of a cell and contain a binding site that binds the cell to certain
15 glycoproteins and therefore mediate cell-cell and cell-extracellular matrix (ECM) interactions.

They are heterodimer transmembrane proteins that consist of an alpha unit and a beta unit. The integrin family has been
20 designated a standard nomenclature system based upon the structure of the alpha unit and the beta unit of the receptor. Therefore, all compounds that have the designation α_v each share the same alpha unit. All compounds that have the β_3 designation have the same beta subunit. The various combinations of those
25 subunits give a wide array of heterodimers with distinct cellular and adhesive specificities.

The family includes cell adhesion receptors such as $\alpha_{IIb}\beta_3$ (previously called GpIIb/IIIa, generally known as the fibrinogen
30 receptor), $\alpha_v\beta_3$ (generally known as the vitronectin receptor), and $\alpha_v\beta_5$ (generally known as the osteopontin receptor).

Some integrins (including $\alpha_{IIb}\beta_3$, $\alpha_v\beta_3$ and $\alpha_v\beta_5$) bind to a group of glycoproteins that contain the tripeptide moiety, Arg-Gly-Asp (RGD). While several members of the integrin family
35 members may bind to RGD containing proteins, the physical

configuration of the binding site on each protein affects binding affinity between the integrin and the RGD containing glycoprotein. Nonetheless, each integrin may be capable of binding to more than one molecule containing the RGD moiety with
5 differing degrees of effectiveness.

The integrin, $\alpha_v\beta_3$, is a particularly important integrin family member that has a wide range of reactivity. It is expressed on a variety of cells, including endothelial cells, osteoclasts,
10 platelets, and smooth muscle cells, and binds to vitronectin and plays an important role in bone resorption, angiogenesis, and neovascularization. The binding of $\alpha_v\beta_3$ to vitronectin is an important step in the process of angiogenesis or neovascularization.

15 Angiogenesis is described as the formation of new blood vessels into a tissue. Angiogenesis is an important process in neonatal growth, but is also important in wound healing and in the pathogenesis of a large variety of clinically important
20 diseases including tissue inflammation, arthritis, psoriasis, cancer, diabetic retinopathy, macular degeneration and other neovascular eye diseases. These clinical entities associated with angiogenesis are referred to as angiogenic diseases. See Folkman et al., Science, 235:442-447 (1987) and Folkman et al.,
25 J.B.C., 267: 10931-10934 (1992).

It has been postulated that the growth of tumors depends on an adequate blood supply, which in turn is dependent on the growth of new vessels into the tumor; thus inhibition of angiogenesis
30 can cause tumor regression in animal models. Integrin antagonists, such as $\alpha_v\beta_3$ antagonists which inhibit angiogenesis are therefore useful in the treatment of cancer for inhibiting tumor growth.

35 Inhibiting angiogenesis will slow or halt the growth of tumors. Inhibition of $\alpha_v\beta_3$ is believed to cause tumor regression and induce apoptosis. The $\alpha_v\beta_3$ integrin also binds to bone matrix

proteins that contain the RGD moiety such as osteopontin, bone sialoprotein and thrombospondin. Inhibition of $\alpha_v\beta_3$ is believed to have potential therapeutic value in the prevention of osteoporosis. $\alpha_v\beta_3$ is implicated in bone resorption at the level of osteoclasts and in osteoporosis such as described in WO 98/31359, WO 98/08840 and WO 98/18461.

The binding of integrins such as $\alpha_v\beta_3$, $\alpha_v\beta_1$ and $\alpha_v\beta_5$ to fibronectin has been linked to the specific internalization of *Neisseria gonorrhoeae* bacteria into epithelial cells. Additionally, the binding of RGD containing domain of exogenous HIV-1 Tat protein is believed to decrease the function of dendritic cells, possibly impairing antigen presentation.

The integrin, $\alpha_v\beta_5$, known primarily as the osteopontin receptor binds to other RGD containing molecules including vitronectin. Inhibitors of $\alpha_v\beta_5$ have potential therapeutic value in the treatment in osteoporosis and angiogenesis.

Because of the similarity of molecules in the integrin family, integrins exhibit a considerable degree of cross reactivity as is illustrated above with the discussion regarding the $\alpha_v\beta_3$ and $\alpha_v\beta_5$ integrins. However, the inhibition of $\alpha_v\beta_3$ and $\alpha_v\beta_5$ or other integrins are rather unpredictable. One effective inhibitor of $\alpha_v\beta_3$ may be also effective inhibitor of $\alpha_{IIB}\beta_3$ but not of $\alpha_v\beta_5$. Other inhibitors may selectively inhibit one integrin but not inhibit other integrins. The use of a compound for a particular application may depend upon which integrins it inhibits and to what extent it inhibits other molecules.

There have been several publications which disclose potential inhibitors of $\alpha_v\beta_3$. Some of these publications include Haubner et al., "Structural and Functional Aspects of RGD-Containing Cyclic Pentapeptides as Highly Potent and Selective Integrin $\alpha_v\beta_3$ Antagonists," J. Am. Chem. Soc., Vol. 118, 7461-7472

(1996); Wong et al., "Studies on $\alpha_v\beta_3$ /Ligand Interactions Using a [^3H]SK&F-107260 Binding Assay," Molec. Pharm, Vol. 50, pp. 529-537, (1996); Brooks, "Integrin $\alpha_v\beta_3$: A Therapeutic Target," DN&P Vol. 8(10), pp. 456-460 (1997); Samanen et al., "Vascular

10

There are other publications which disclose inhibitors of other integrins. Some of these publications include PCT Pub. No. WO 94/08577 to Merck & Co.; U.S. Patent No. 5,084,466 to Alig et al.; PCT Publ. No. WO 97/01540 to Smithkline Beecham
15 Corporation; Kunicki et al., "Exchange of Arg-Gly-Asp (RGD) and Arg-Tyr-Asp (RYD) Binding Sequences in a Recombinant Murine Fab Fragment" J. Bio. Chem, Vol. 270, No. 28, pp. 16660-16665 (1995); PCT Publ. No. WO 98/05774 to Merck & Co. Inc; U.S. Pat. No. 5,227,490 to Hartman et al.; U.S. Pat. No. 5,082,942 to
20 Mahuzier; PCT WO 97/26250 to Merck & Co.

However, despite all of the studies on integrin receptor antagonists, there is still a need for compounds that bind to particular integrins effectively and particularly can
25 effectively bind to α_v integrins including $\alpha_v\beta_3$ and/or $\alpha_{11b}\beta_3$. This invention satisfies these and other needs.

The therapeutic use of certain quinolizininone derivatives has been described previously. For example, Y.Kitaura et al., in US
30 Pat. No. 4,650,804 issued Mar.17, 1987 have disclosed quinolizininone compounds having a tetrazolylcarbamoyl substituent which are useful for the treatment of allergic and ulcer diseases.

35 J.V.Heck and E.D.Thorsett, in US Pat. No 4,921,857 issued May 1, 1990 have disclosed the use of certain 4-oxo-4H-quinolizine-3-

carboxylic acids and derivatives thereof for treating bacterial infections.

Y.Kurashiva et Al. in US Patent 4,935,425 issued June 19, 1990
5 have disclosed 4H-quinolizin-4-ones for treatment of diseases associated with immunoglobulin E-antibody formation. However, quinolizinone compounds have not been described for the use of angiogenesis inhibitors.

10 Presently, there is a need to identify compounds which bind to integrin receptors. There is a further need to identify compounds which bind to the $\alpha_v\beta_3$ receptor as well as the $\alpha_{IIb}\beta_3$ receptor both individually and collectively.

15 Additionally, there is a present need to identify integrin antagonist compounds which are useful agents for inhibiting and arresting angiogenesis. The present invention satisfies these and other needs.

using conventional preparative steps and recovery methods known
to those skilled in the art of organic chemistry. Synthetic
routes according to one or more embodiments of the invention are
illustrated in the following Schemes A-G and described below.

15 Preparation of a 7,3 - Quinolizinone Framework

As per Scheme A, a compound A-1 such as
5-hydroxy-2-methylpyridine is treated with strong base such as
n-butyl lithium in an anhydrous solvent, for example THF, at low
temperature and then coupled with diethyl ethoxymethylene
20 malonate. The resulting alkylated product is converted into
7-hydroxy-4-oxo-4H-quinolizine -3-carboxylic acid ethyl ester by
refluxing in an aromatic solvent such as xylenes. The compound
A-2 such as 7,3-quinolizinone ester is then treated with a strong
base such as NaH, in an anhydrous solvent, and the resulting
25 anion is reacted with compatibly functionalised -L-K-J-Lg
bearing if necessary appropriate protecting groups and wherein
L'g is a leaving group. Hydrolysis of the ethyl ester is done
by treating the compound A-3 such as the coupled quinolizinone
with an hydroxide such as lithium hydroxide. The resulting acid
30 compound A-4 is coupled with appropriately functionalised
nucleophiles bearing the -L-K-J in its masked or current form in
a solvent such as DMF in the presence of a coupling reagent such
as (O-(7-azobenzotriazol-1-yl)-1,3,3-tetramethyluronium
hexafluorophosphate), HATU, to provide compound A-5 such as
35 functionalised 7,3-quinolozinone. Someone versed in the art of
organic synthesis will recognize that the preparation of A-5 as

described in this invention may require the use of protecting groups compatible with the synthetic sequence and removed when required. Alternatively and if more appropriate, the functionality -X-Y-Z could be introduced first onto protected quinolizinones A6 as described for A-4 to give compound A-7, which after deprotection to A-8 can then be coupled as described for A-4 to give A-5. It shall be further understood that functional group interconversions can be carried out at any stage of the synthesis provided that reaction conditions for such conversions are compatible with other structural moieties. When compatibility problems are encountered, protecting groups could be used prior to functional group interconversion.

15 Scheme A - Preparation of 7,3 Quinolizinone Framework

Preparation of 7,2 and 8,2 Quinolizinone Framework

20 Core 7-hydroxy and 8-hydroxy-4-oxo-4H-quinolizine-2-carboxylic acid methyl esters are prepared using Scheme B.

Hence, for the 7,2-substituted framework compound B-1 such as, 2-methyl-5-hydroxy-pyridine is treated with a strong base such as NaH in anhydrous DMSO and then alkylated using, for example,

benzyl bromide. The resultant benzyloxy pyridine such as compound B-2 is then oxydised with an agent such as 3-chloroperoxybenzoic acid (MCPBA) in a solvent such as dichloromethane to give the pyridine-N-oxide (compound B-3),
5 which after stirring in hot acetic anhydride (100°C) provides 2-acetoxymethyl-5-benzyloxy pyridine. This compound B-3 is then stirred in a solvent such as methanol and treated with base such as potassium carbonate. The resulting alcohol is oxidised with an oxydizing agent such as MnO₂ in dry solvent for example
10 dichloromethane in order to obtain compound B-4. Wittig coupling reaction between, for example 2-(diethoxyphosphonyl)-succinic acid dimethyl ester, (R' = C₁-C₈ straight chain alkyl) and 5-benzyloxy-pyridine-2-carbaldehyde in a solvent such as THF and using base like NaH provides the
15 vinolygous adduct (compound B-5). This compound B-5 can be cyclised in heated solvents, for instance xylenes, in the presence of acid typically p-toluenesulfonic acid in order to obtain compound B-6. Debenzylation of the resulting quinolizininone in a solvent mixture such as dioxane/methanol in
20 the presence of palladium over charcoal under hydrogen atmosphere provides compound B-7 such as the core 7-hydroxy-4-oxo-4H-quinolizine-2-carboxylic acid methyl ester.

The 8-hydroxy regioisomer is obtained from the same synthetic
25 approach with the use of 2-methyl-6-hydroxypyridine.

R' = C₁₋₈ straight chain alkyl.

Scheme B - Preparation of 7,2 and 8,2 Quinolizininone FrameworkPreparation of 7,2 and 8,2 Substituted Quinolizininone Integrin5 Inhibitors

7,2 and 8,2 functionalised quinolizininones can be prepared as per synthetic scheme C. Essentially, C-3 is prepared from B-7 by using the same synthetic approach as described for A-5 from A-2 in scheme A.

10

It shall be further understood that functional group interconversions can be carried out at any stage of the synthesis provided that reaction conditions for such conversions are compatible with other structural moieties. When

15 compatibility problems are encountered, protecting groups could be used prior to functional group interconversion.

Integrin Inhibitors

5 Preparation of 7 or 8 Aminomethyl Linked Quinolizininones

When C-7 or C-8 carbon linked quinolizininones are desired, these are prepared as per Scheme D. The compound D-1, corresponding to B-7, such as 7-hydroxy-4-oxo-4H-quinolizine-2-carboxylic acid methyl ester is reacted with an anhydride such as triflic anhydride and the resulting leaving group is displaced by cyanide ion by using for example potassium cyanide in the presence of palladium. Resulting compound D-2 such as 7-cyanoquinolizininone is treated with hydrogen in the presence of palladium over charcoal, followed by protection of the amino or coupling with L-K-J-L'g to give D-2. Compound D-3 such as 7-tert-butoxycarbonylamino-methyl-4-oxo-4H-quinolizine-2-carboxylic acid methyl ester is reacted with base, such as lithium hydroxide and then coupled with a nucleophilic group comprising X-Y-Z to provide compound D-4. Compound D-4 results from coupling with L-K-J-L'g, using coupling reagents such as HATU and reactions well known in the art, and aminomethyl intermediates obtained after the removal of protecting group Pg from the C-7 amino substituent.

25 Treatment of D-6 with a base such as lithium hydroxide, followed with coupling reaction to a nucleophilic group comprising -X-Y-Z in the presence of a coupling reagent such as HATU provides 7-carbon linked quinolizininones of formula D-5 as described herein.

- An alternative route to 7-cyano quinolizininone D-2 is depicted in scheme D. thus, treatment of 5-Cyano-2-methylpyridine D-01 with an oxydising agent such as selenium dioxide in a solvent such as dioxane provided pyridine aldehyde D-02 which can be coupled
- 5 with diethyl ethoxymethylene malonate under anhydrous basic conditions, obtained for example with NaH in tetrahydrofuran. The resulting adduct is converted directly to D-02 by refluxing in an aromatic solvent such as xylenes.
- 10 It shall be further understood that functional group interconversions can be carried out at any stage of the synthesis provided that reaction conditions for such conversions are compatible with other structural moieties. When
- 15 compatibility problems are encountered, protection groups could be used prior to functional group interconversion.

When C-8 aminomethyl quinolizininones are desired, it will be appreciated that the same synthetic route as depicted in Scheme D could be used when 4-cyano-2-methylpyridine is used instead

20 of 5-cyano-2-methylpyridine compound D-01.

Scheme D. Preparation of 7 or 8 Aminoethyl Linked QuinolizinsonesPreparation of 7 or 8 Aminomethyl Linked5 Tetrahydroquinolizinsones

C-7 or C-8 carbon linked tetrahydroquinolizinsones are prepared according to scheme E in which the synthetic route is illustrated for the C-7 tetrahydroquinolizinsones E-3. Hence, E-3 is prepared from E-1 or E-4 using the general scheme process described for converting D-6 or D-4 into D-5 from scheme D. E-1 is prepared by treating 7-Cyanoquinolizinsones D-2 first with excess H₂/Pd/C followed with coupling of 7-aminomethyltetrahydroquinolizinsones with a nucleophile comprising

L-K-J-L'g. E-4 is obtained by treating D-2 first with excess $H_2/Pd/C$, then protecting the 7-aminomethyl group as per the art, followed with basic hydrolysis with a base such as lithium hydroxide and coupling with a nucleophile comprising -X-Y-Z.

5

It shall be understood that functional group interconversions can be carried out at any stage of the synthesis provided that reaction conditions for such conversions are compatible with other structural moieties. When compatibility problems are encountered, protecting groups could be used prior to functional group interconversion.

Scheme E. Preparation of 7 or 8 Aminoethyl Tetrahydroquinolizinones

15

Preparation of 8,3 and 8,2-Substituted Quinolizininone Series
Bearing an Amino Linker in the L-K-J group.

As in Scheme F, the compound F-1 is 4-chloro-2-methylpyridine and is treated with a strong non nucleophilic base such as lithium diisopropylamide and then coupled with diethyl ethoxymethylene malonate. The resulting adduct F-2 is cyclized in refluxing solvent such as xylenes to provide after basic hydrolysis (eg. LiOH) compound F-3 such as 8-chloro-4-oxo-4H-quinolizine-3-carboxylic acid. This compound F-3 is then coupled with nucleophiles incorporating the group -X-Y-Z in the presence of a coupling reagent such as HATU, typically in a dry solvent such as DMF. The resulting adduct (compound F-4) can then be coupled with aminomethylbenzene and treated with base, for example lithium hydroxide, to afford after debenzylation compound F-5, which can then be used to prepare 8,3-disubstituted quinolizininone F-6 by coupling F-5 with L-K-J-L'g wherein L'g is a leaving group.

Other analogs are prepared by treating the compound F-4 with nucleophilic groups comprising L-K-J in the presence or absence of base in dry solvent to provide compound F-7. It shall be further understood that functional group interconversions can be carried out at any stage of the synthesis provided that reaction conditions for such conversions are compatible with other structural moieties. When compatibility problems are encountered, protecting groups could be used prior to functional group interconversion.

8,2-substituted quinolizininones containing an amino linker are prepared by following Scheme F, as described above, provided that 5-chloro-2-methyl pyridine is used instead of F-1.

Scheme F - 8,3 and 8,2 Quinolizininone Series Bearing An Amino Linker in the L-K-J Group

5

Solid phase Approach To Synthesize 8, 3 - Series Quinolizininones

Such as described in Scheme G, substituted amino propionic acid, G-1, is suitably protected with an amino protecting group such as Fmoc. The protected compound, G-2, is anchored to a resin such as Wang resin to produce G-3. After deprotection of the amino group of G-3, it is then coupled to a quinolizininone carboxylic acid derivative via standard peptide coupling techniques to give compound G-4. Substitution of the chlorine group of G-4 employing monoamines or diamines furnished G-5 and G-6, respectively. Compound G-6 can be further elaborated through reactions of the free terminal amine.

30

capsules, caplets, powders, transdermal patches, granules, lozenges, suppositories, reconstitutable powders, or liquid preparations, such as oral or sterile parenteral solutions or suspensions.

5

In order to obtain consistency of administration, it is preferred that a composition of the invention is in the form of a unit dose. The unit dose presentation forms for oral administration may be tablets and capsules and may contain
10 conventional excipients. For example, binding agents, such as acacia, gelatin, sorbitol, or polyvinylpyrrolidone; fillers, such as lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tableting lubricants such as magnesium stearate; disintegrants, such as starch, polyvinylpyrrolidone,
15 sodium starch glycollate or microcrystalline cellulose; or pharmaceutically acceptable wetting agents such as sodium lauryl sulphate.

The compounds may be injected parenterally; this being
20 intramuscularly, intravenously, or subcutaneously. For parenteral administration, the compound may be used in the form of sterile solutions containing other solutes, for example, sufficient saline or glucose to make the solution isotonic. The amount of active ingredient administered parenterally will be
25 approximately 0.01 to 250 mg/kg/day, preferably about 1 to 10 mg/kg/day, more preferably about 0.5 to 30 mg/kg/day, and more most preferably about 1-20 mg/kg/day.

35 which each active ingredient is mixed with sugar or corn syrups, flavoring agents and dyes, and then dehydrated sufficiently to make the mixture suitable for pressing into solid form. The amount of active ingredient administered orally will depend on

bioavailability of the specific compound. The amount of active ingredient administered orally will be approximately 0.01 to 250 mg/kg/day, preferably about 1 to 10 mg/kg/day, more preferably about 0.5 to 30 mg/kg/day, and more most preferably about 1-20
5 mg/kg/day.

The tablets may be coated according to methods well known in normal pharmaceutical practice, in particular with an enteric
15 coating.

Oral liquid preparations may be in the form of emulsions, syrups, or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use.
20 Such liquid preparations may or may not contain conventional additives. For example suspending agents, such as sorbitol, syrup, methyl cellulose, gelatin, hydroxyethylcellulose, carboxymethylcellulose, aluminum stearate gel, or hydrogenated edible fats; emulsifying agents, such as sorbitan monooleate or

35 prepared by utilizing the peptide and a sterile vehicle, and, depending on the concentration employed, may be either suspended or dissolved in the vehicle. Once in solution, the compound may be injected and filter sterilized before filling a suitable vial

or ampoule and subsequently sealing the carrier or storage package. Adjuvants, such as a local anesthetic, a preservative or a buffering agent, may be dissolved in the vehicle prior to use. Stability of the pharmaceutical composition may be enhanced by freezing the composition after filling the vial and removing the water under vacuum, (e.g., freeze drying the composition). Parenteral suspensions may be prepared in substantially the same manner, except that the peptide should be suspended in the vehicle rather than being dissolved, and, further, sterilization is not achievable by filtration. The compound may be sterilized, however, by exposing it to ethylene oxide before suspending it in the sterile vehicle. A surfactant or wetting solution may be advantageously included in the composition to facilitate uniform distribution of the compound.

The pharmaceutical composition of this invention comprise a compound of formula I or II and a pharmaceutically acceptable carrier, diluent or adjuvant. Typically, they contain from about 0.1% to about 99% by weight of active compound, and preferably from about 10% to about 60% by weight depending on which method of administration is employed.

A pharmaceutically effective amount of compounds of the invention can be determined according to one or more of the assays described in detail in the examples. Under these particular conditions, a compound having such activity will exhibit an IC_{50} of approximately 50 $\mu\text{g/ml}$ or less, preferably 25 $\mu\text{g/ml}$ or less, more preferably 10 $\mu\text{g/ml}$ or less, and most preferably less than 1 $\mu\text{g/ml}$.

Physicians will determine the dosage of the present therapeutic agents which will be most suitable. Dosages may vary with the mode of administration and the particular compound chosen. In addition, the dosage may vary with the particular patient under treatment. The dosage of the compound used in the treatment will vary, depending on viral load, the weight of the patient, the relative efficacy of the compound and the judgment of the

treating physician. Such therapy may extend for several weeks or months, in an intermittent or uninterrupted manner.

Example 1: Synthesis of the Compounds

Compound I: (S)-2-benzenesulfonylamino-3-{[7-(5-aminopentyloxy)-4-oxo-4H-quinolizine-3-carbonyl]-amino}-propionic acid TFA salt.

Step A- Preparation of 7-hydroxy-4-oxo-4H-quinolizine-3-carboxylic acid ethyl ester.

To a mixture of 6-methyl-pyridin-3-ol (2.000g, 18.327 mmol) in 160 ml of anhydrous THF was added at -78°C, 16.1 ml (40.319 mmol) of 2.5 M n-butyllithium in hexane. The mixture was stirred at -78°C for 20 minutes followed by 1.5 hour at room temperature. The mixture was then cooled down to -78 ° C. and a solution of diethyl ethoxymethylene malonate (3.963 g, 18.327 mmol) in 20 ml of the same solvent was added dropwise. The mixture was stirred at -30°C for 1 hour, quenched with NH₄Cl sat. and extracted with dichloromethane (3x). The combined organic layers were washed with water and concentrated. Example 2: Fibrinogen Binding to Immobilized GP IIb-IIIa ($\alpha_{IIb}\beta_3$) and $\alpha_v\beta_3$

The wells of plastic microtiter plates were coated overnight at 4 °C with purified active GP IIb-IIIa (Calbiochem) or placental $\alpha_v\beta_3$ at 0.5 µg/ml (100 µL/well) in a buffer containing 150 mM NaCl, 20 mM Tris, pH 7.4, and including 1 mM CaCl₂ for GP IIb-IIIa or 1mM MgCl₂ and 0.2 mM MnCl₂ for $\alpha_v\beta_3$. Blocking of nonspecific sites was achieved by incubating the wells with 35 mg/ml bovine serum albumin (BSA) for at least 2 hours at 37 °C. Biotinylated-fibrinogen (10 nM) was added to the wells in triplicate in the absence or presence of increasing concentrations of compounds of interest (0.001-100 µM) and further incubated for 2 hours at 37 °C.

Nonbound fibrinogen was removed by five washes with binding buffer. Avidin conjugated to alkaline phosphatase (Sigma), diluted in binding buffer, was added and incubated for two hours at 37 °C. The plates were washed five times with binding buffer, and after addition of the substrate PNPP (Pierce), the enzyme activity was measured by the absorbance at 405 nm. The concentration of inhibitor required to inhibit 50% of biotinylated-fibrinogen binding was defined as IC₅₀ determined by a nonlinear, sigmoidal dose response variable slope from the GraphPad Prism software.

The results of these tests are reported in Table 1 below.

Example 3: Cell Attachment Assay

5 The wells of 96-well plates (Immunolon) were coated, by incubation overnight at 4 °C, with 5 µg/ml of vitronectin or osteopontin, 10 µg/ml of fibronectin or 10 mg/ml BSA in PBS. The protein solution was flicked out and the wells were blocked with 10 mg/ml BSA (0.1 ml) for 1-2 hours at 37 °C. Cells [HT29 (ATCC),
 10 HMVEC (Cell Systems), K562 or K562 transfected with αvβ3 (Blystone et al., 1994)] were loaded with a fluorescent marker, 5-chloromethylfluorescein diacetate (Molecular Probes, Eugene, Or) for 1 hour at 37 °C, then incubated in fresh medium without the fluorescent marker for 1 hour.

15 Cells were lifted with trypsin-EDTA and washed two times with Hank's balanced salt solution (Sigma) supplemented with 1 mM MgCl₂. Cells (75,000 cells/well) were added to coated plates in triplicate and allowed to attach at 37 °C for 1 hour in the
 20 presence or absence of specific antibodies at 5 µ/ml or increasing concentrations of compounds of interest (0.001-10 µM). Nonadherent cells were removed by gentle washing twice with PBS. The adherent cells were solubilized with 1% triton X-100 and detected using a fluorescence plate reader (Perkin Elmer).

25 The number of attached cells was calculated based upon standard curves for each cell line used in the experiment. Non-specific

cell attachment (attachment to wells coated with BSA) was always less than 5%. The results presented are the average of triplicate samples and representative of several separate assays.

Example 5: Chick Chorioallantoic Membrane (CAM) assay

5 *Shell-less embryo culture*

Fertilized white leghorn chicken eggs (SPAFAS Inc., Norwich, CT) were received at day 0 and incubated for 3 days at 37 C with constant humidity. On day 3, eggs were rinsed with 70% ethanol and opened into 100 mm² tissue culture coated Petri dishes under
 10 aseptic conditions. The embryos were then returned to a humidified 38 C incubator for 7-9 additional days.

Mesh assay

Vitrogen (Collagen Biomaterials, Palo Alto, CA) at a final
 15 concentration of 0.73 mg/ml and Matrigel (Becton Dickinson, Bedford, MA) at a final concentration of 10 mg/ml was directly pipetted onto Nylon meshes with 250 µm² openings which were cut into 4 mm x 4 mm squares and autoclaved. Polymerization of meshes were under aseptic conditions, on bacteriological Petri
 20 dishes. The polymerization conditions for each substrate were identical; after mixing with or without 250 µg of VPF/VEGF₁₆₅ (Peprotech, Rocky Hill, NJ) and/or compounds of interest, 40 µl were pipetted onto each mesh in a bacteriological Petri dish. The Petri dish was placed in a humidified 37 C incubator with 5%
 25 CO₂ for 30 minutes to allow polymerization followed by an incubation at 4 C for 2 hours.

In a tissue culture enclosure, meshes were placed onto the periphery of the CAM of a day 12-14 embryo, excluding areas
 30 containing major vessels. The embryos were then returned to the

humidified 38 C incubator with 3% CO₂ for 24 to 48 additional hours.

Visualization and Quantification of vessels

- 5 Embryos were removed from the incubator and meshes were viewed under a dissecting microscope for gross evaluation. Injection of 400 µl FITC dextran, MW 2,000,000 (Sigma, St. Louis, MO) through glass microcapillary tubes by infusion into the umbilical vein was performed at a rate of 200 µl per minute.
- 10 The FITC dextran was allowed to circulate for 5 minutes and 3.7% formaldehyde in PBS was applied directly on each mesh. The embryos were then incubated at 4 C for 5 minutes and the meshes were dissected off the CAM and fixed in 3.7% formaldehyde for 10 minutes to overnight.
- 15 After fixation, meshes were mounted on slides with 90% glycerol in PBS and visualized on an inverted fluorescence microscope. A Nikon Diaphot with a Sony DXC-151A camera attached to the side port was used for capture of images and analysis was with the
- 20 NIH Image 1.61 software program. For each mesh, 5 random staggered images (approximately 600 µm each) were captured. The areas of high intensity were highlighted and measured. Results are expressed as ability to suppress capillary formation after subtraction from negative control. Values were calculated as %
- 25 inhibition, considering 100% the capillary density achieved by VPF in the presence of vitrogen alone minus the background levels in the absence of VPF. Negative values indicate angiogenic stimulation above the VPF positive control.
- 30 The results of these tests are reported in Table 4 below.
